

Haven Animal Hospital

Spay & Neuter Pre-op Visit

- To prepare for surgery, all pets start with a complete examination. We will verify all vaccinations are current, any overdue vaccines must be updated prior to scheduling surgery. To ensure the safety of all pets in our care, we require all vaccines be performed by a veterinarian. Cats must be current on rabies and HCP vaccines. Dogs must be current on rabies, DAPP and Bordetella vaccines.
- An ECG heart function test is performed to determine the type of medications that can be used for surgery.
- Preventive care lab profile is recommended for pets of all ages to confirm internal organ function is normal prior to undergoing surgery. Lab work is required on pets with health concerns and pets 2 years and older. Please bring a fresh stool sample collected within 4 hours of visit or refrigerate no longer than 12 hours prior to visit.
- Additional testing or treatment may be needed based on your pet's examination findings.
- During your pre-op visit we will collect prepayment for surgery. This will ensure you can be scheduled in a timely manner once test results are in.

Haven Animal Hospital

Spay & Neuter Surgery Day

- Fasting is required for anesthesia. We ask that you do not allow access to food or water after 8pm the night before surgery.
- You will drop your pet off in the morning the day of surgery. We will keep in touch with you throughout the day with status updates on your pet.
- An additional pre-operative examination is performed on surgery day to confirm there have been no changes to your pet's health.
- We will place an intravenous catheter* to administer injections. Your pet will receive medications for pain management, to control nausea/vomiting, antibiotic to prevent infection, local anesthesia at incision site as well as general anesthesia. We maintain your pet on inhalation gas anesthesia during the procedure. We monitor heart rate and blood oxygen levels while your pet is anesthetized.
- *Male cats will not receive IV catheter
- We utilize laser therapy to stimulate the cells and tissue, reduce inflammation and minimize pain after surgery. Laser therapy is highly recommended but not required.
- Many pets receive internal dissolving sutures, although some require external sutures or staples that will need to be removed in 2 weeks. All pets are sent home with an E-collar to prevent licking and chewing at the incision site. The E-collar will remain in place until the recheck in 2 weeks, or longer if not completely healed at that time.
- We often send home sedatives after a spay or neuter to facilitate restricted activity. There will be a charge for this prescription.
